

# Want to make more things in Australia?

Start by making the power to make everything else.

Clean energy, owned by us, sold to industry at cost.

About half the price the big energy companies charge.

**Back  
Sovereign  
Power.**

**Our power. Our industry. OUR FUTURE.**

# Making things in Australia has to add up.

Power is the one big cost we can actually change.

## **What is Sovereign Power?**

A publicly owned renewable generator with one job: power Australian industry at cost. It builds wind and solar and sells the electricity to energy-hungry industries like steel, aluminium and critical minerals.

## **Why do we need it?**

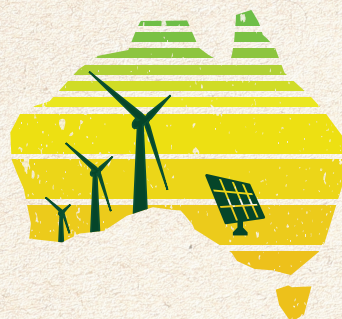

Private power adds a huge markup. That markup is killing the case for making things here.

## **Will it help households?**

Yes. Taking big industrial users out of the market brings electricity prices down for everyone.

## **Do other countries do this?**

Nearly every country that makes steel and aluminium has state-owned power behind it. France, China, Singapore and Qatar own generators in Australia right now. Time our own government stepped up.

## **Back Sovereign Power.**

**Our power.**

**Our industry.**

**OUR FUTURE.**
